Fiber optic communication systems are becoming prevalent in part because service providers want to deliver high bandwidth communication capabilities (e.g., data and voice) to customers. Fiber optic communication systems employ a network of fiber optic cables to transmit large volumes of data and voice signals over relatively long distances. Optical fiber connectors are an essential part of most fiber optic communication systems. Fiber optic connectors allow two optical fibers to be quickly optically connected without requiring a splice. Fiber optic connectors can be used to optically interconnect two lengths of optical fiber, or can be used to interconnect a length of optical fiber to an optical device such as an optical transceiver, optical transmitter, optical receiver, etc. Fiber optic connectors can be used in the optical fibers of fiber optic communication systems to provide a quick means of interconnecting two lengths of optical fiber. A fiber optic connector includes a ferrule assembly including a tubular member for accepting the end portion of an optical fiber. An optical fiber is inserted into the ferrule and is held in position by a fiber clamp. A fiber optic connector can also be used to interconnect a length of optical fiber to an optical device such as an optical transmitter, optical receiver, etc. An end of an optical fiber is stripped. The stripped end is inserted into a ferrule of a fiber optic connector. The fiber optic connector is then mated to an optical device which is attached to a printed circuit board. The use of fiber optic connectors in the foregoing applications involves a number of considerations. For example, it is desirable to have a fiber optic connector that is easy to use with conventional tools for quickly and easily inserting or extracting an optical fiber. It is also important for fiber optic connectors to be extremely low cost. One type of fiber optic connector is an active alignment type connector. Active alignment type connectors include a ferrule assembly having one or more beam splitters for splitting an incoming light signal, one or more lenses for focusing the split light signals, and an alignment device (e.g., an alignment sleeve) for guiding the ferrule assembly during assembly. Active alignment type connectors generally require an alignment sleeve that is capable of being used in conjunction with an optical device, such as an optical transceiver, optical

receiver, or the like. Consequently, the alignment sleeve must be able to guide the ferrule assembly during assembly of the connector. The alignment sleeve must be constructed so that it can be removed and replaced in the assembly process. Thus, alignment sleeves are relatively delicate
